What Is Belbien?

Belbien is often prescribed for short-term treatment of insomnia or sleep disturbances that interfere with daily functioning.

In the USA, Belbien is a **Schedule IV controlled medication**, which means it is available only by prescription. Dosage and Usage Guidelines

Belbien is usually prescribed in 5 mg or 10 mg doses, depending on age, tolerance, and medical condition. It should be taken right before bedtime, as it works within 15–30 minutes. Avoid alcohol or other sedatives while taking Belbien, as it can intensify drowsiness or cause side effects such as dizziness or confusion.

Patients are generally advised to use Belbien for short-term treatment — typically not longer than 2–4 weeks — to prevent dependence or tolerance buildup. Always follow your physician's guidance strictly.
